EDUCATION

- K L University** Hyderabad, India
B.Tech in Computer Science and Engineering (Hons.) — CGPA: 9.41/10 2023 – 2027

SKILLS SUMMARY

- Languages:** Python, SQL, TypeScript, JavaScript (ES6+), Dart, Java, C++
- Frontend:** React, Next.js, Flutter, OpenLayers, Responsive UI Development, Component Architecture, State Management
- Backend:** Node.js, Express, Spring Boot, Django, REST APIs, WebSockets, Microservices
- Databases & Storage:** PostgreSQL, MongoDB, Redis, ChromaDB, Data Modeling, Query Optimization, Milvus
- AI / ML:** NLP, Retrieval-Augmented Generation (RAG), Ollama, OpenWebUI, Vector Search, Scikit-learn
- Infrastructure:** Docker, Linux, RabbitMQ, GitHub Actions, CI/CD, Containerized Deployments
- Data Engineering & GIS:** ETL Pipelines, Spatial Queries, GeoJSON, GeoParquet, Data Ingestion Systems

EXPERIENCE

- SPL Systems** Hyderabad, India
Software Engineer Intern
 - Backend Development & Deployment:** Developed and maintained core web applications and backend services, implementing robust new features and ensuring highly reliable production deployments.
 - Linux Server Administration:** Provisioned and administered Linux-based infrastructure to host internal business applications and databases, optimizing system reliability, security, and operational uptime..
 - AI Service Integration:** Deployed and managed containerized AI services (Ollama and OpenWebUI) to support scalable document-processing workflows, enabling centralized API access to OCR extraction and locally hosted LLMs
 - Database & Service Management:** Configured, monitored, and optimized databases and supporting backend microservices, executing seamless API integrations, updates, and advanced troubleshooting to support daily operations.
- Water Watchers** Remote, Canada
Frontend Engineer Intern
 - Donation Platform Optimization:** Redesigned and optimized the organization's donation experience, improving usability across desktop and mobile devices while streamlining critical user journeys to increase donation completion efficiency.
 - UI/UX Iteration & Stakeholder Collaboration:** Collaborated closely with project managers to prototype, evaluate, and refine multiple interface designs, translating stakeholder feedback into production-ready user experiences aligned with organizational goals.
 - Reliability & Quality Assurance:** Developed testing specifications and validated donation workflows to ensure payment flows, form submissions, and donation processing logic functioned reliably across supported browsers and devices.
 - Performance Engineering:** Customized and optimized NationBuilder CMS templates by reducing redundant client-side scripts, improving asset delivery, and enhancing maintainability of the donation platform codebase.

PROJECTS

- Velar — Intelligent Personal Finance Management System (Flutter, Node.js, MongoDB, RabbitMQ, Python):**
 - Architected and developed a scalable, event-driven microservices backend using Python and Node.js to power a personal finance management platform.
 - Built robust REST APIs and asynchronous processing workflows utilizing RabbitMQ workers, enabling highly reliable transaction ingestion and state management.
 - Engineered complex data extraction pipelines to parse transaction records from Google Pay PDF statements, utilizing regular expressions to extract visual coordinates and accurately model financial data.
 - Optimized system reliability by designing a hybrid classification engine that safely integrates ML inference with deterministic backend rules, ensuring secure and accurate categorization at scale.
- MapLayer — GeoRAG Property Intelligence Platform (React, OpenLayers, TypeScript, GeoJSON):**
 - Developed a scalable backend REST API using Python and FastAPI to analyze geospatial hazards and process complex zoning shapefiles.
 - Engineered high-performance spatial query pipelines utilizing MongoDB and FastMCP, enabling efficient data extraction and address-level geographic search.
 - Architected a GeoRAG microservice combining spatial indexing and Milvus vector retrieval to power natural-language queries across hundreds of megabytes of GIS datasets.
 - Integrated self-hosted LLMs (Gemma, Qwen) into the backend architecture to generate grounded property insights from retrieved flood, infrastructure, and land-use context.
